

MindArena – MVP Strategy and Project Scope

1. Introduction

This document presents a strategic approach for the development of the MindArena platform as a Minimum Viable Product (MVP). The objective is to implement a solid, functional, and coherent core system, while leaving more advanced features as part of future improvements.

2. Development Strategy

Instead of attempting to build the entire system, the focus is placed on delivering a high-quality core implementation. 40% of the system will be fully developed and functional, while 60% will be defined as future enhancements. This ensures stability, clarity, and feasibility.

3. Core Features (MVP – 40%)

3.1 User Management: User registration, authentication, and profile creation (skills, interests).

3.2 Arena System: Display arenas (Coding, Business, etc.) and allow users to join them.

3.3 Challenge System: Create challenges, view them, and submit text-based responses.

3.4 Basic Ranking System: Submission = +10 points, Upvote = +2 points, with leaderboard per arena.

4. System Capabilities

The MVP includes authentication, challenge creation, user interaction (submissions and voting), and a basic ranking system, making the platform already functional and interactive.

5. Future Enhancements (60%)

AI recommendations, team matching, advanced gamification, real-time competitions, mobile version, and company integrations.

6. Conclusion

The MVP approach ensures a realistic, scalable, and technically solid system aligned with professional development practices.
